DECLARATION

To,

The Principal,
Balwant College, Vita

Respected Sir,

I undersigned hereby declared that submitted project is fully designed and developed by me as per Shivaji University, Kolhapur. The project report entitled **"House Rental System"** written and submitted under the guidance of **Miss. Jadhav.R.B.** is our original work.

The empirical findings in the report are based on the data collected by us preparing project report, we have not copied from any report, we understand that any coping is liable to punish in a way the University authorities deem fit.

Your sincerely,

Anjali Hanamant Yewale
Sayali Ananda Ingavale

Place:-Vita.

Date: - / /20

ACKNOWLEDGEMENT

Let us take the privilege for thanking persons those who helped us a lot in successfully completing our project **"House Rental System"** might be expected withto so many persons. However, we sincerely hope that none should be overlooked. The first and the foremost credit of project work goes to **Miss. Jadhav.R.B.** whose proper guidance made this project work complete. He is always present to solve the pettiest of problems and silliest of doubts without losing her patience.

During the course of this work, at **"Balwant college, Vita"** we are supported by **Miss.Jadhav R.B.** and all the staff of Balwant College's for giving us tremendous support and help whenever needed.

Thanks to Prof. **Miss. Jadhav.R.B.** for being always ready and willingto assist us whenever we faced difficulties. We think all the concerned people who helped to us and the entire staff of computer department for their co-operation to assist us in completing the project work so easily.

Thank You,

Place: Vita

ABOUT PROJECT

In this project “House Rental System” is a house rental and property listing project. This Web application helps user to register individual home or apartment to assist you in finding the perfect rental home or property. Also you can find your next rental from search view in your targeted area. In this project two major modules that have been provided are administrator module and user module. This website is designed to attend to all our needs from renting of property in India. Here we found the better opportunity to invest our value of entire life. For rental house, it is very difficult to find the same recommendation system and usually the owner not advertise their house on Internet but, promote it to the resident. Problem arise when it is hard to find the nearby house rental with the University, College, Village and City. Usually, the Renter and Also College Student will go out and ask for the resident. It will take so much time for student to find their shelter for the whole semester. To solve this problem, we need a platform that will help customer to find the house. The owner promote house.

OBJECTIVES OF THE SYSTEM

The objective of this project entitled “House Rental System” is to provide a user friendly and easily understandable GUI to manage the details of House, Rent, Customer, Payment, House status. It manages all the information about House, Rent and Booking and house status. This project also helps users to search home on rent in particular city.

The Broad objective of this project is to develop a software to maintain related issues. The Specific objective of the project are listed below.

- Store and manage rent, renter, owner Details.
- Store and retrieve monthly Rent Report.
- Reduce Duplication Of The information.

SCOPE OF THE SYSTEM

Housing has a central importance to quality of life with considerable economic, social, cultural and personal significance. Though a countries national prosperity is usually measured in economic terms, increasing wealth is of diminished value unless all can share its benefits and if the growing wealth is not used to redress growing social deficiencies, one of which is housing.

Housing plays a huge role in revitalizing economic growth in any country, with shelter being among key indicators of development. The focus of this research project is basically managing housing for low income, medium and high incomes households or what is commonly known as affordable housing. "Affordable" is a term used to describe individuals capability to pay for certain products or services because their income is enough to do so. Although the term "Affordable Housing" is often applied to rental housing; that is within the financial means of those in the lower income ranges of a geographical area, the concept is applicable to both middle and high income individuals.

USER REQUIREMENTS

- Content generation and updation will be done timely by the user.
- Portal Management Framework will be devised and user will play active role in it.
- Commitment from information resources will be required.
- Easy to use
- Easy to handle

EXISTING SYSTEM

Currently the most property managers manage property and tenants details on papers. Once customers finds a vacant house, they can call or email manager of the houses indicating the size of the house they would like rented to them. The property manager can email them back giving them all the details about the house they are requesting. The details include; Rent per month Deposit paid Terms and conditions to follow acceptance. With the current system recording the details of various activities of user is completely manual and entails a lot of paper work The existing system only provides text based interface which is not as user friendly as Graphical user interface. Since the system is implemented manually, the response is very slow Disadvantages of existing system:

- Inconsistency in data entry, room for errors, miss keying information.
- Large ongoing staff training cost.
- System is dependent on good individuals
- Reduction in sharing information and customer services & Lack of security
- Time consuming and costly to produce reports.

PROPOSED SYSTEM

The online house rental system site is available in the market that can serve users to search home and also facilitates owner user to upload house details for rent our house.

Advantages of Proposed System:

• Users can search home on rent by selecting city.

• Users can view the home details and owner details

• Admin can manage the customer and owner.

• House Owner can upload the house details and pics of house and rent information.

• More backend and database security

• More user friendly interface

• More module will be included

HARDWARE & SOFTWARE REQUIREMENTS

System requirement divided into two categories

Hardware Requirement:-

- Hard Disk :- 1 TB
- RAM:- 16 GB
- Processor:-Intel i3/i5

Software Requirement:-

- Front End:- JSP,HTML,CSS
- Back End language: Java
- Back END Dataabse: Mysql
- Operating System: Windows 10
- Tool: Eclipce

MODULES

Admin Module :

- Manage Users
- Manage House Details
- See House rent Orders and manage status
- See house rent payments.

User Module :

- Search House Details
- View House Information
- Send Rent Order
- Payment of monthly house rent.

SYSTEM ANALYSIS

Requirement analysis is the main activities that must be undertaken to have a clear understanding of the system that is being used. Studying the requirement analysis of the existing system brings about an important contribution to the entire development process. It is after the compilation of this step that we can realize what goes wrong, which activities are right and which activities should be encouraged. And what alternative methods should be taken to increase the performance of the proposed system and to make the new system fully applicable by the particular organization

Requirements Gathering: The first step in system analysis is to gather requirements from stakeholders, including House rental company owners, employees, and customers. The requirements may include features, functionalities, user roles, systemperformance, security, and integration with other systems.

Use Case Analysis: Identify the main actors involved in the House rental system, such as customers, employees, and administrators. Create use case diagrams to represent the interactions between these actors and the system. Identify the primary use cases, such as booking a House, checking car availability, managing reservations, and generating reports.

Data Modeling: Analyze the data requirements of the House rental system. Identify the main entities, such as cars, customers, reservations, and transactions. Create an entity-relationship diagram (ERD) to visualize the relationships between these entities. Define attributes for each entity and specify their data types.

Process Modeling: Analyze the main processes or activities involved in the rental system. Create a process flow diagram or a sequence diagram to illustrate the flow of activities in different use cases. Identify the inputs, outputs, and data transformations associated with each process.

FEASIBILITY STUDY

Feasibility study is a study that determines whether a proposed system is technically, financially,and operationally viable. A feasibility study is a test of system proposal according to its workability, impact on the organization, ability to meet user needs and effective use of resources.

Technical feasibility

The proposed system can be easily maintain and repair, because the system is developed by familiar programming language The project team members learned programming languages that required for the successful completion of the project such as java script, CSS, HTML,JSP,MySQL.These languages are simple, open source and already known, so the team developedthe system easily

Economic feasibility

The purpose of the economic feasibility assessment is to determine the positive economic benefits to the organization that the proposed system provides. It includes quantification and identification of all the benefits expected. This assessment typically involves a cost/ benefits analysis. House rent site is available to anybody and anywhere. So the system is more functional in reducing costs from both users and the owner.

Operational feasibility

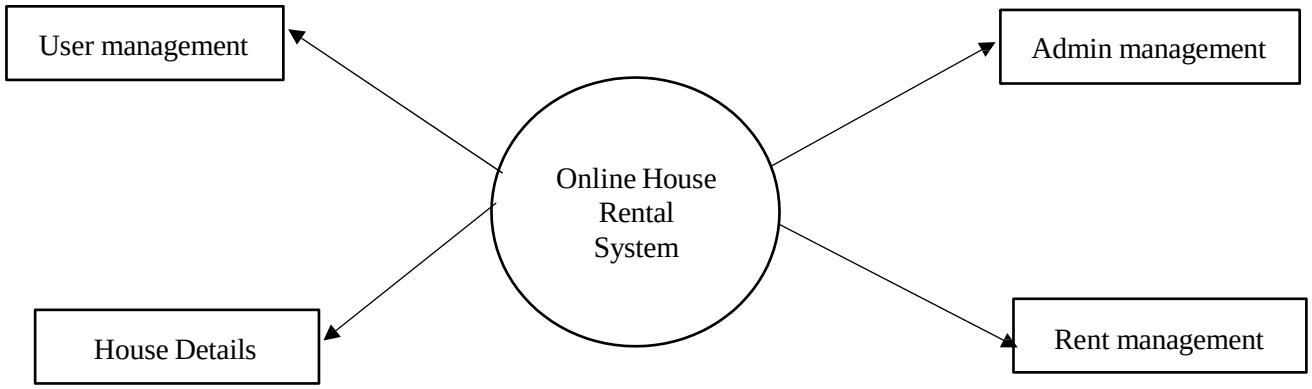

The proposed system has been operationally functional and user friendly. The users of systemuse the system to perform its regular task without any ambiguity. The user of the system canunderstand the new system with little trial. Operationally, the system has capable of producing quick and qualitative services to user's .therefore, the system developed is operationally morefeasible.

Legal feasibility

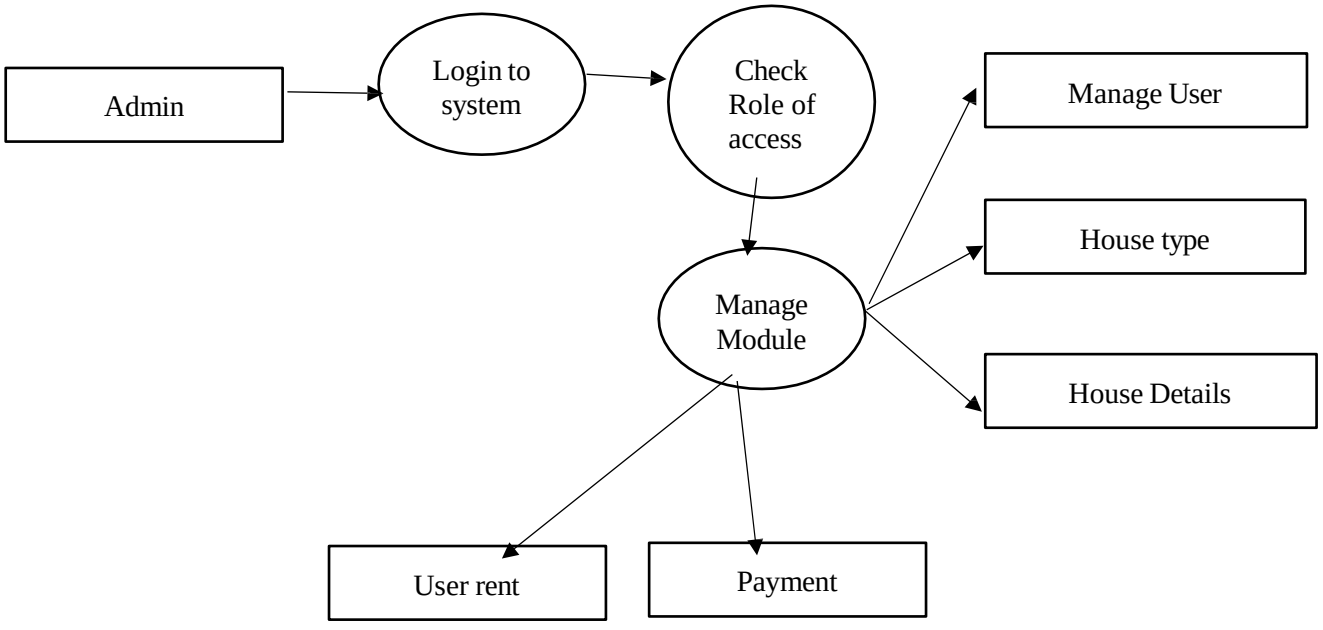

The proposed system is legally feasible since it does not violet or contradict any law, regulation,custom, value of Ethiopian constitution and Ethiopian statistical agency

FUTURE ENHANCEMENT

- Module of online payment in new system using electronic card.

- Google map in order to improve functionality.

CONCLUSION

Online web based smart house renting system has been developed in this paper. The system can provide a framework that allows managers to conduct reasonable transactions within a limited time frame. This system is meant to satisfy the needs of rental house owners. Several user-friendly interfaces have also been adopted. The real time chat system will bring fluidity over the usage and connection between owner and tenants. Also, the location tracing system will be a major advantage for users as it will be easy to find the location of the house on a map. In addition, for the concern of security, this system has optimized secure and private data storage and verification system. This package will prove to be very powerful in satisfying all the requirements of the users
